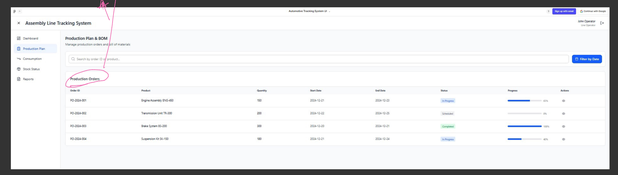
Columns Mapping:		
UI Column	Table	Column
Order ID	production_plan	order_id
Product	production_plan	model
Quantity	production_plan	plan_qty
Start Date	production_plan	start_date
End Date	production_plan	end_date

Process Logic | Filter by

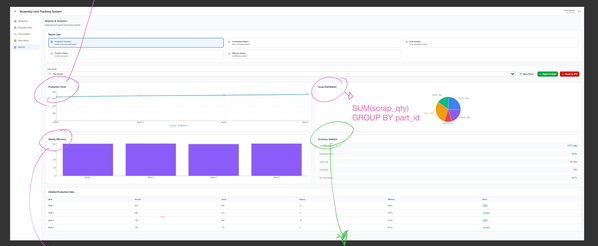
progress = SUM(consumption.actual_qty) / production_plan.plan_qty

WHERE consumption.order_id = production_plan.order_id

ดึงจาก ตาราง Production_Plan



SUM(actual_qty) GROUP BY week



SUM(scrap_qty) GROUP BY part_id

SUM(actual_qty) / SUM(planned_qty) GROUP BY week

Summary Statistics

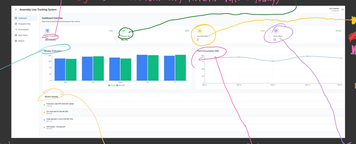
Metric	Formula
Total Production	SUM(actual_qty)
Average Efficiency	AVG(efficiency)
Total Scrap	SUM(scrap_qty)
Scrap Rate	SUM(scrap_qty)/ SUM(actual_qty)
On-time Delivery	completed_on_time / total_orders

Today's Production
Table Production Plan / Production Data
Column :
- Order ID
- Quantity
- วันที่เริ่มผลิต (start date / Production day)

Logic SUM (Actual Qty WHERE Date = Today)

Efficiency Rate
File Production Plan + Consumption
Column :
- Planned Qty
- Actual Qty

คูณ (Actual Qty / Planned Qty) x 100



Low Stock Alerts
ไฟล์ NG assembly_Local part list.xlsx
Column : - Current Stock
- minimum stock

Logic COUNT (PART WHERE Current stock < minimum Stock)

Weekly Production
แยกเป็นรายสัปดาห์ :
- Planned
- Actual
ตาม week
(Mon-Fri (Work day))

SUM(actual_qty)
GROUP BY part_id

Active orders
File: Production Plan
Column : - Status

Logic (COUNT Order WHERE Status = 'In Progress')

Source Table
ตารางหลัก : Productio_plan
ตารางรอง : consumption
column ที่ใช้
From production_plan
- order_id
- quantity_planned
- start_date
From consumption
- order_id (FK)
- actual_qty
- recorded_at
Logic การดึงข้อมูล
Planned (ต่อ week)
sql : SUM(quantity_planned)
GROUP BY WEEK(start_date)
Actual (ต่อ week)

SUM (actual_qty)
GROUP BY WEEK(recorded_at)

แสดงข้อมูลการล่าสุด
- Production order started
- Low stock alert
- Scrap reported
- shift started
การดึงตารางไหน :

activity_log

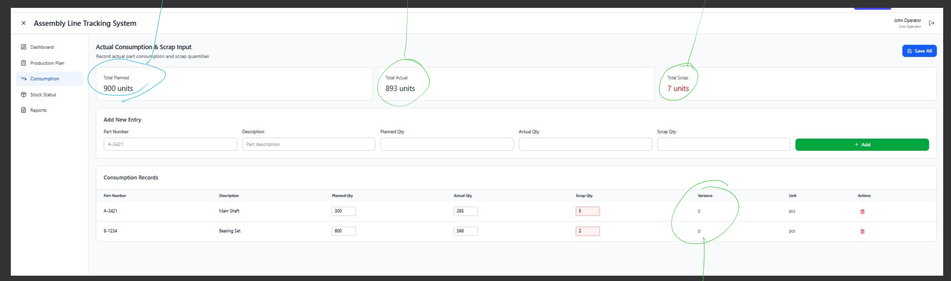
Field Description
activity_id PK
activity_type. production / scrap / stock / shift
reference_id order_id หรือ part_id
message. ข้อความแสดงผล
created_at. เวลา
created_by. user

```
SELECT *
FROM activity_log
ORDER BY created_at DESC
LIMIT 5;
```

SUM(planned_qty)
FROM consumption
WHERE order_id = selected_order

SUM (actual_qty)

SUM (scrap : scrap_qty)



variance = planned_qty - actual_qty
